

# SQL Server Health Check

A Database Review is designed to review and verify the implementation of common SQL Server Best Practices. Our Database Health Check includes all of the usage and administration aspects of SQL Server databases, ensuring that your SQL Servers are managed and operated well. Our approach is to analyse the total health of your SQL Server environment and highlight areas of concern, providing recommendations to improve the health and performance of your database environment including:

- ✓ Database Fragmentation
- ✓ Database Integrity Check
- ✓ Database Options, File Sizing, File Placement
- ✓ Database Recoverability Review
- ✓ Maintenance/Backup Job Review
- ✓ SQL Server Configuration Options
- ✓ SQL Server and Windows Performance Counter Collection
- ✓ SQL Server Security Analysis
- ✓ Table and Index Analysis

At the completion of the Database Health Check you will be presented with a comprehensive report documenting the current SQL Server environment as well as the findings, including recommendations of how to improve the overall health of your SQL Server. Once this report has been presented, we schedule a time to discuss with you each of the findings and help you to prioritise the actions required to ensure the availability and reliability of your SQL Server environment.

*"Our relationship with WARDY IT Solutions has become a crucial aspect to the success of our team. The level of excellence they provide in service and technical support has always been exemplary."*
